# Discovery and Development

- n The time from conception to approval of a new drug is typically 10-15 years
- n The vast majority of molecules fail along the way (>100,000)
- n The estimated cost to bring to market a successful drug is now \$800 million (Dimasi, 2000)

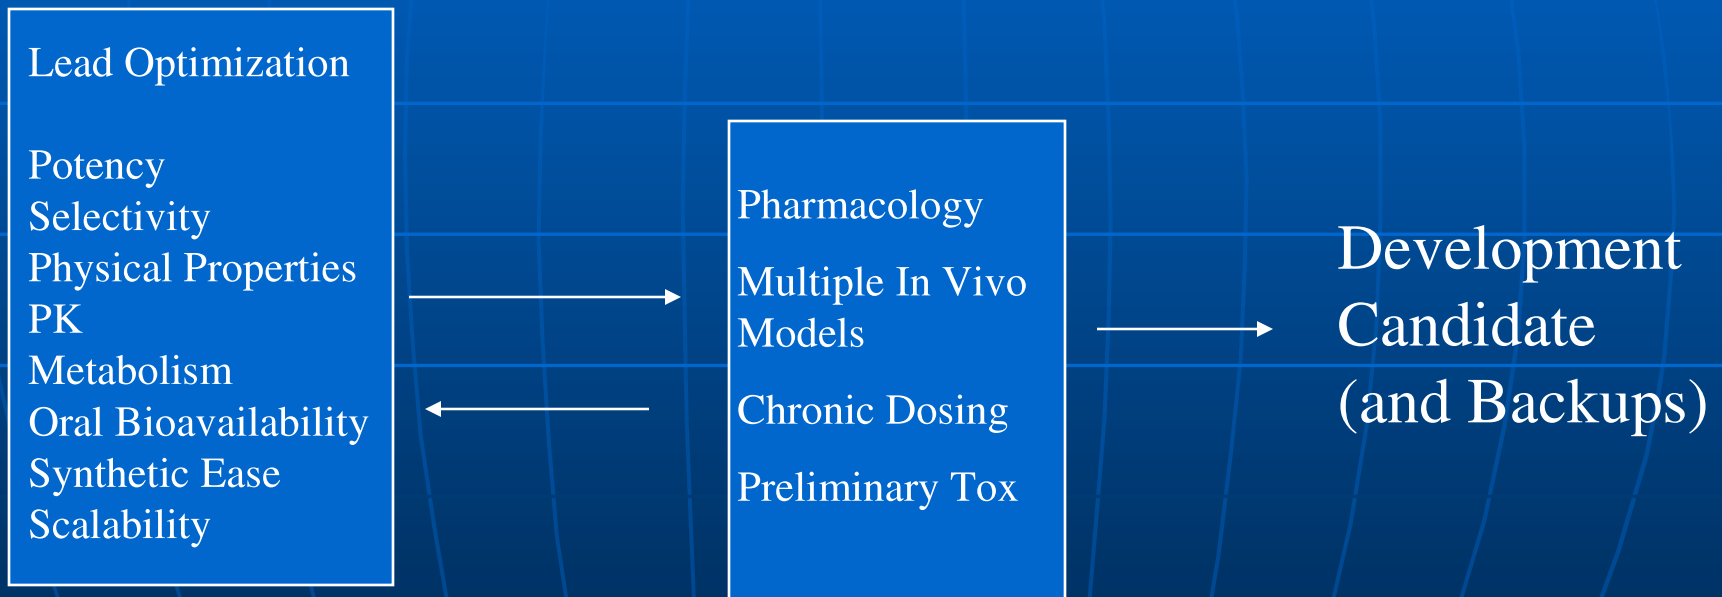

# Drug Discovery Processes Today

# Drug Discovery Processes - II

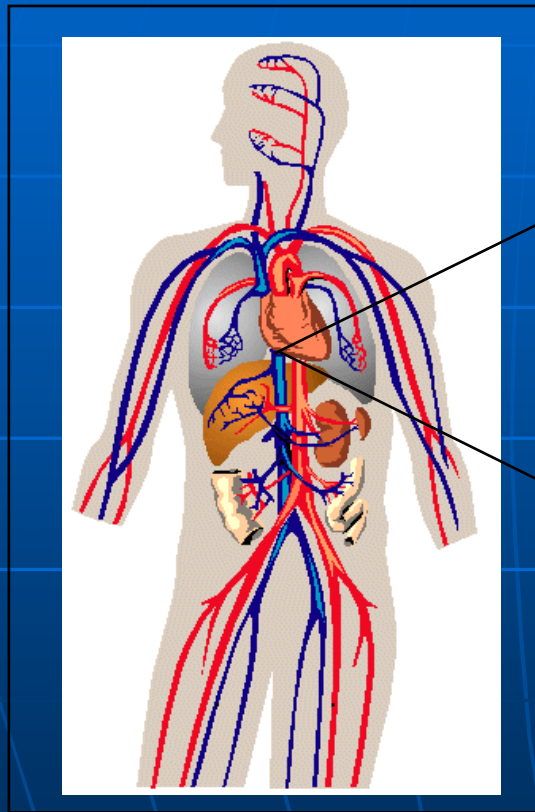

# Drug Discovery Processes - III

# Issues in Drug Discovery

- n Hits and Leads - Is it a "Druggable" target?
- n Resistance
- n Pharmacodynamics and pharmacokinetics
- n Delivery - oral and otherwise
- n Metabolism
- n Solubility, toxicity
- n Patentability

# The Pharmacokinetic System

the medium

the interaction matrix

the ensemble of  
drug particles

# Chemotherapeutic agents' interactions with targets

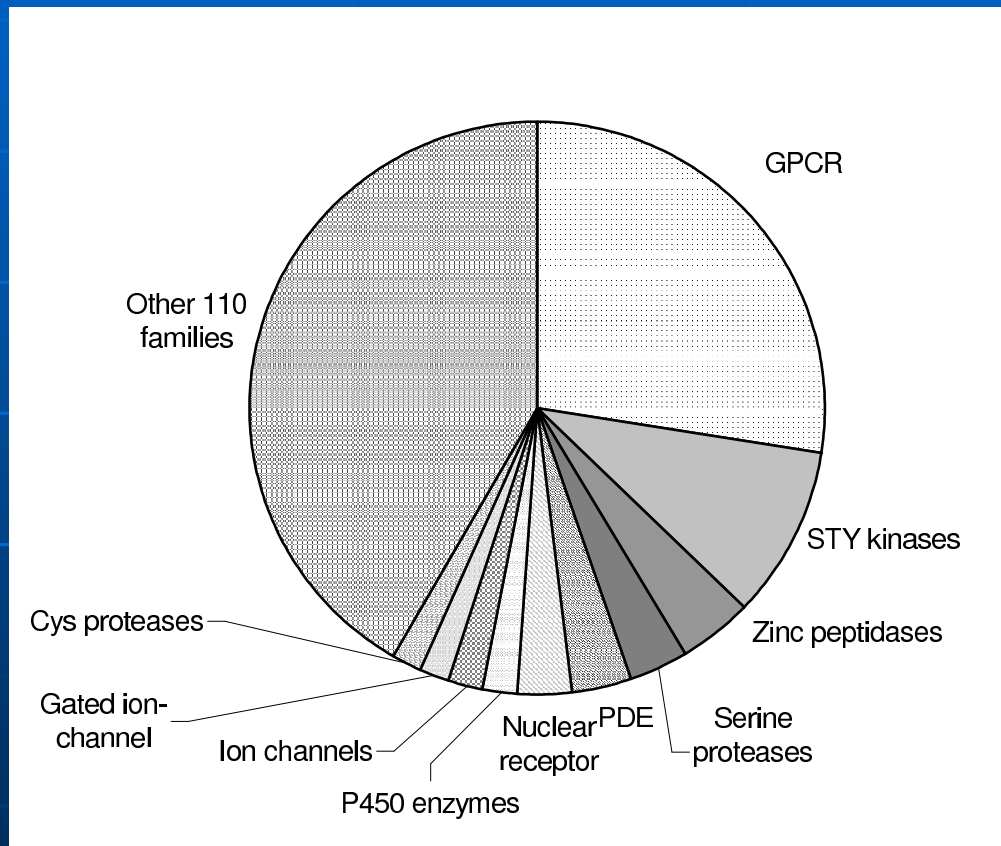

*Target : a molecule whose interaction with an anticancer agent will induce a cytotoxic effect*

Targets are key molecules involved or required for cell mitosis and/or survival

Conventional chemotherapy acts on dividing cells only, but does not distinguish normal and abnormal dividing cells

Targeted agents are designed to act on targets which are specific to tumor cells

# Relating druggable targets to disease...

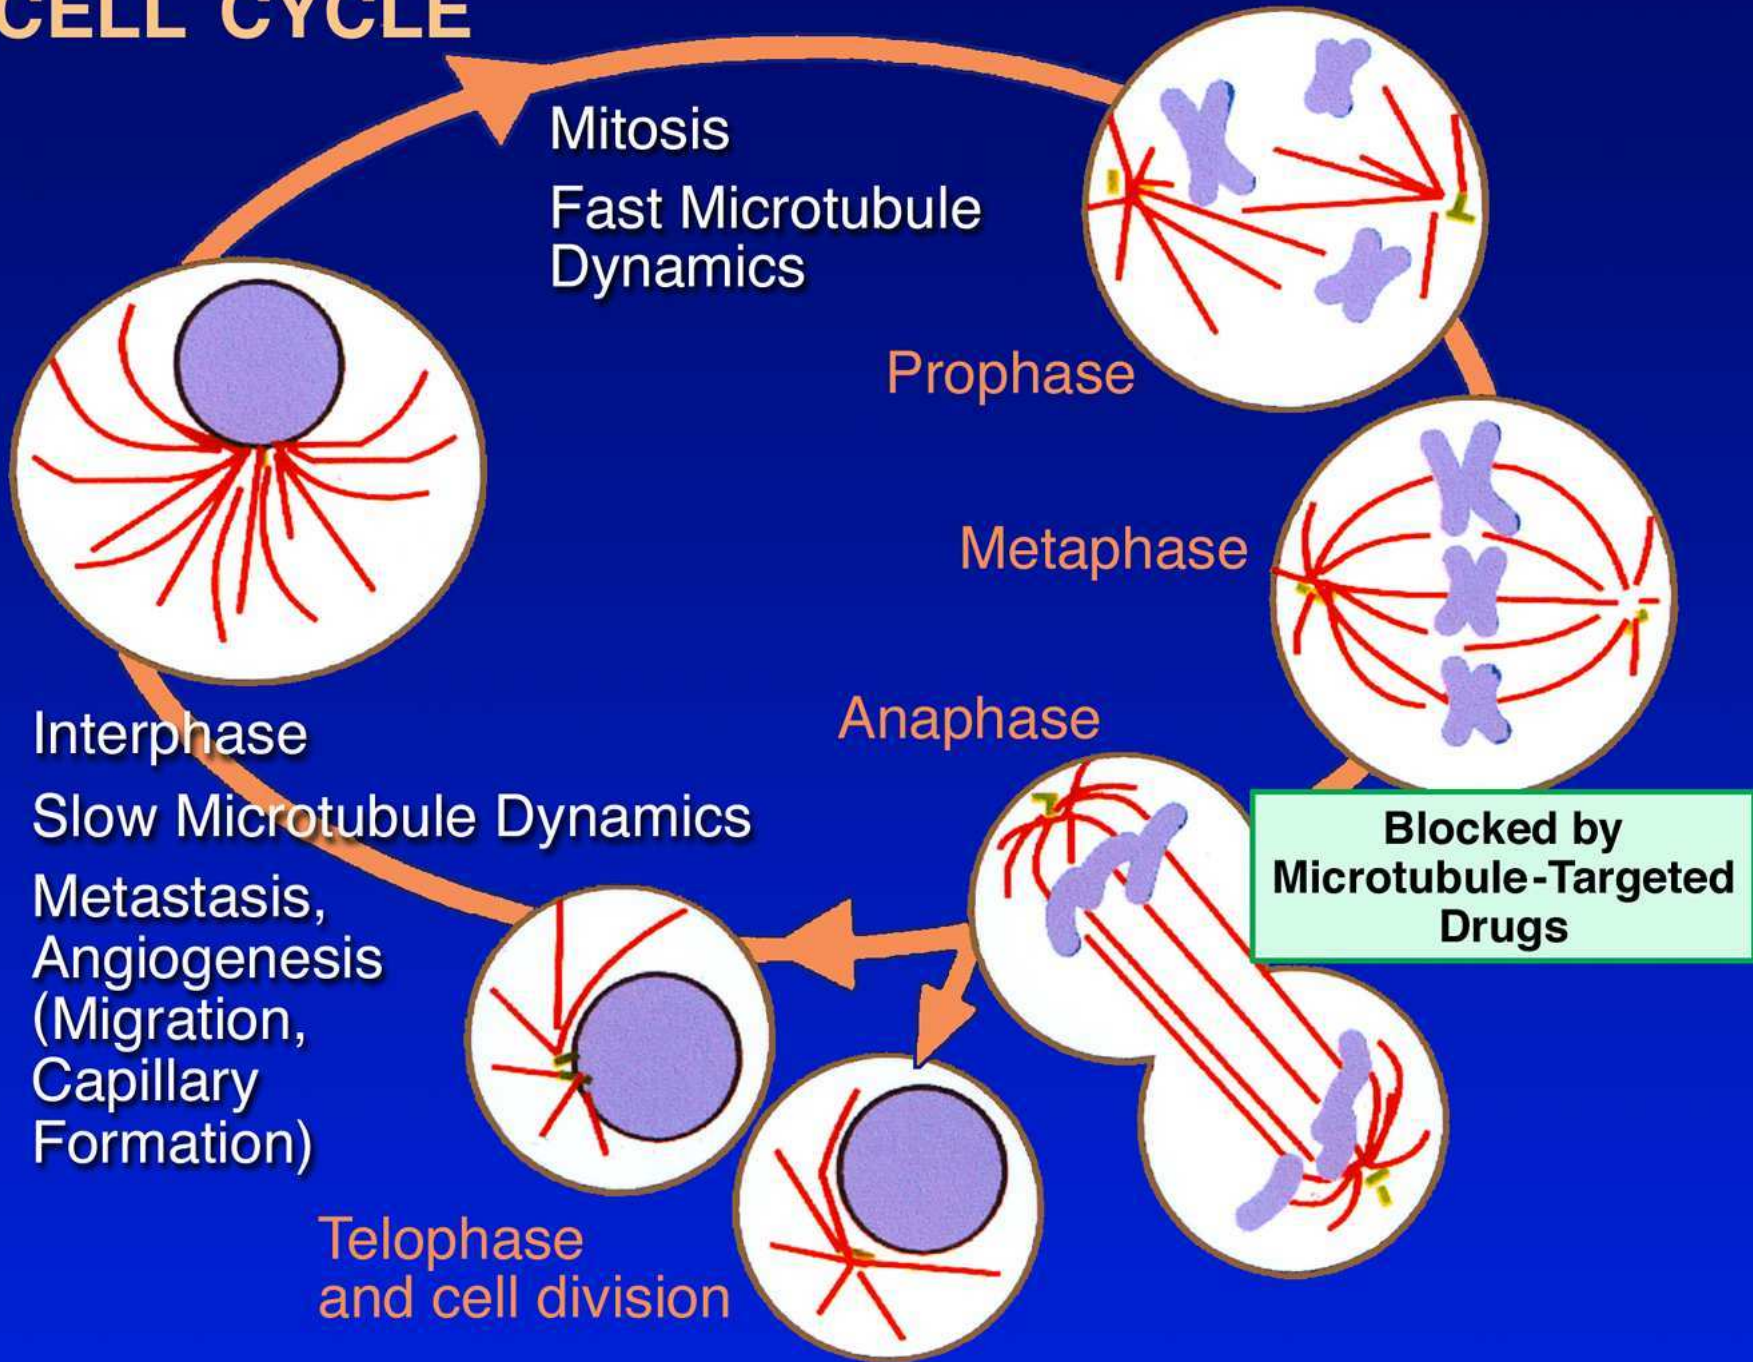

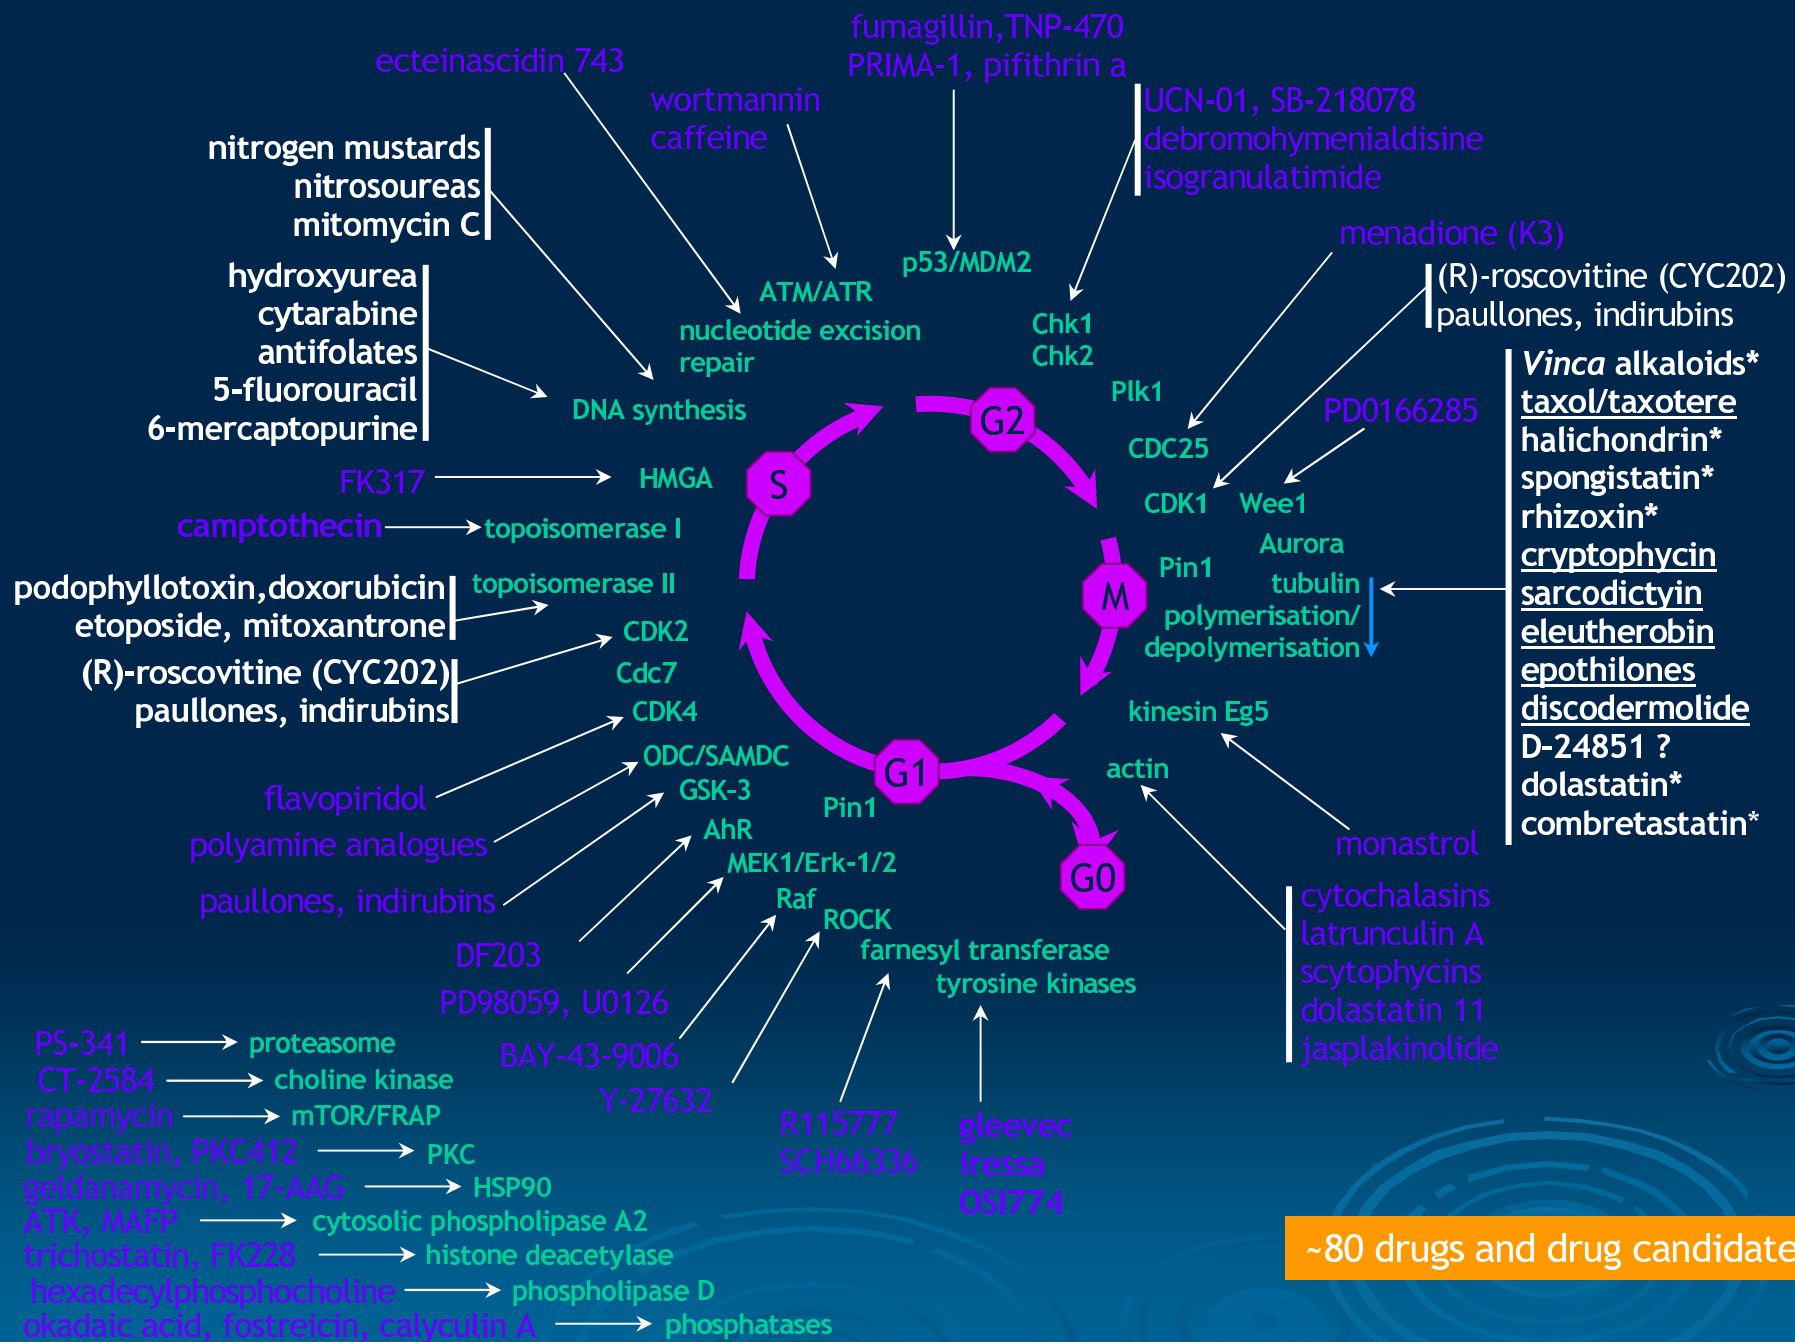

**Fig. 3, Fauman et al.**

Analysis of pharma industry reveals:

- n Over 400 proteins used as drug targets
- n Sequence analysis of these proteins shows that most targets fall within a few major gene families (GPCRs, kinases, proteases and peptidases)

# CELL CYCLE

~80 drugs and drug candidates

Source: Cell cycle laboratory, L. Meijer, Roscoff, France

# Properties and Functions of Cytoskeleton

	Actin Filaments	Intermediate Filaments	Microtubules
<b>Structure</b>	Self-assembling protein, definite directionality	Tough, rope-like fibers	Stiff, hollow tubes of tubulin
<b>Outer diameter</b>	7nm	10nm	24 nm
<b>Tensegrity structure</b>	Tensional component Creates pulling forces	Tension-resistant component, hardens under strain Doesn't generated forces	Compression-resistant component Creates pushing forces
<b>Inhibition by drugs</b>	Cytochalasin B	Acrylamide	Colchicine, nocadzole

# Conventional chemotherapy compounds

## *DNA*

*alkylating agents, platinum compounds,*

- *DNA processing enzymes*
- *Microtubules*

*nucleotide analogues*

*topoisomerase 1 and 2 inhibitors*

*vinca alkaloids, taxanes*

# Targeted agents

*Tyrosine kinases*

*imatinib, sunitinib, ...*

*Membrane antigens*

*monoclonal antibodies:*

*trastuzumab*

**Anti-angiogenesis compounds:**

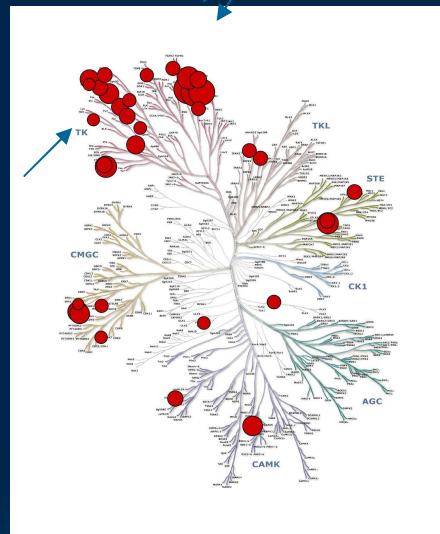

**bevacizumab**

# Targetted ... really ?

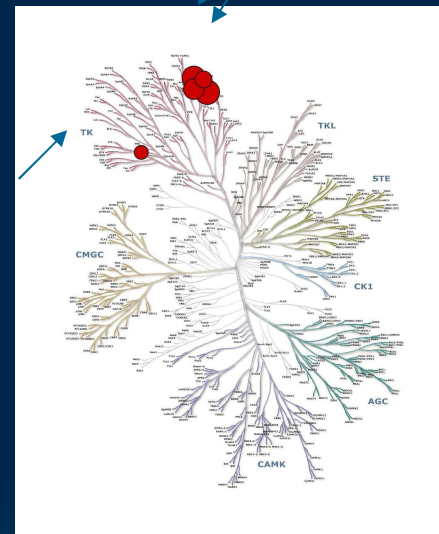

KIT  
PDGFR

Imatinib

Sorafenib  
(BAY43-9006)

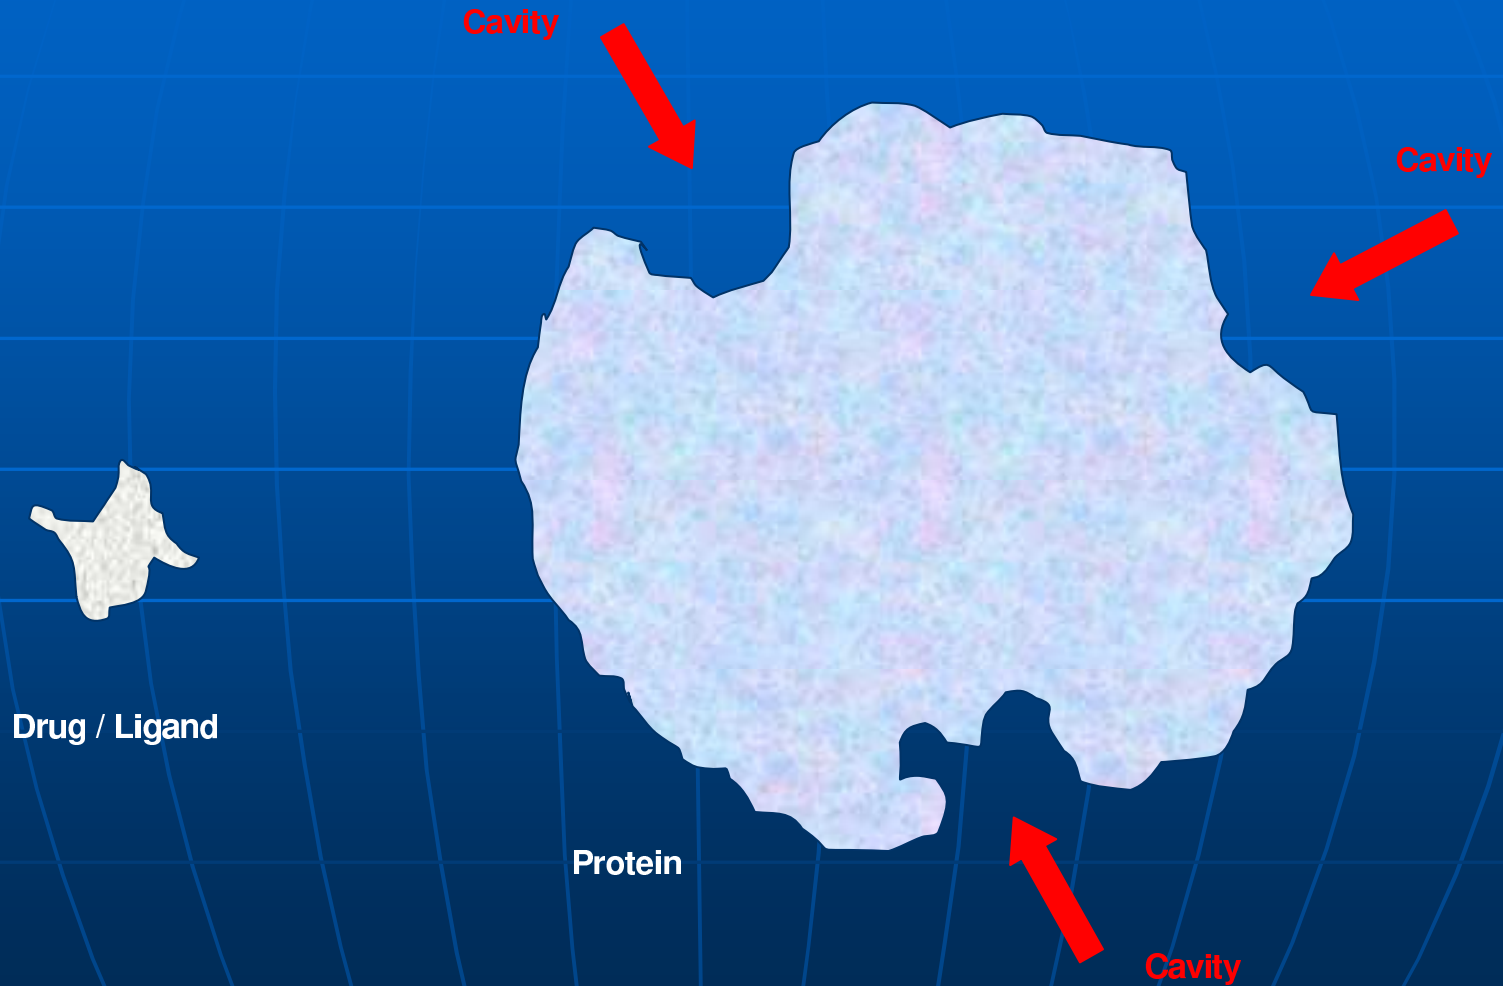

Valatinib  
(PTK787)

Sunitinib  
(SU11248)

# Drug Binding

# Idea of a pocketome

# Growing complexity

**PDB : 48,000 proteins + homologues**  
**Several pockets per protein**

**1500 potential targets (human proteins)**  
**Approx. 400 (80 in cancer) utilized**

**Orange Book: 1800 medicinal drugs**  
**Wishart's Drug Bank: 4900 drugs**  
**Cancer chemotherapy drugs: 103**

**Combinatorial possibilities: infinite**

**Protein-drug interactions but also**  
**Protein-protein interactions**

# Microtubule Reconstruction

# MT's Exhibit Dynamic Instability

## Mechanism:

- Stochastic
- Non-equilibrium
- Enigmatic

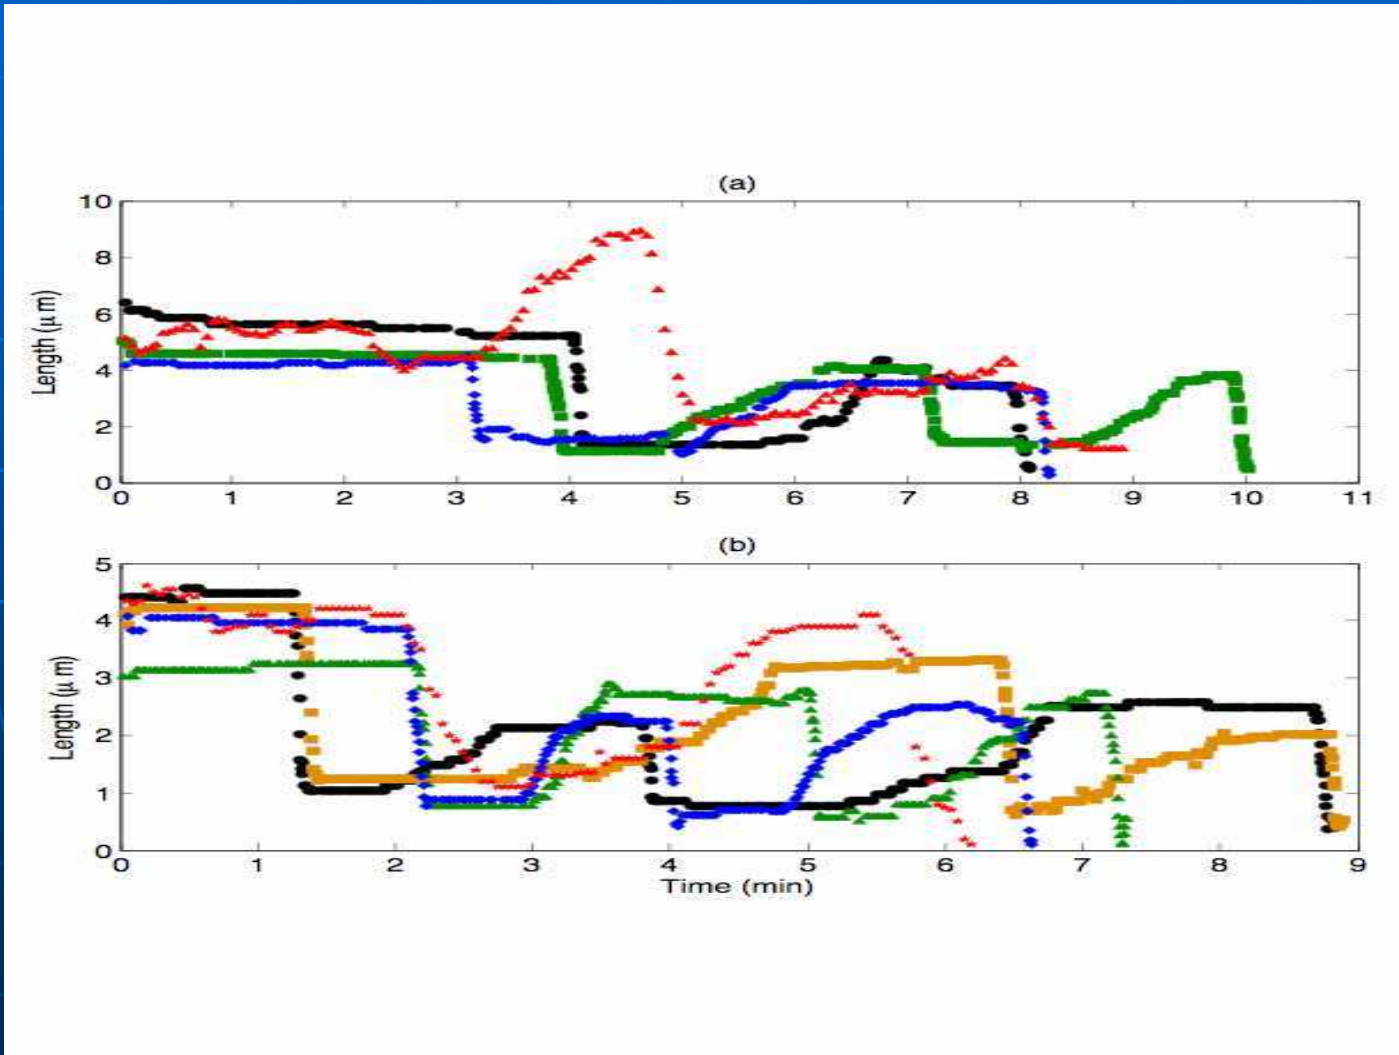

# Individual MT life story: dynamic instability

- Catastrophes
- Rescues
- Growth phase
- Shrinking phase

# MT polymerization for different isotypes of tubulin appears to differ

# Microtubule Dynamics is Exquisitely Regulated in Cells

- n Regulated differentially in different regions of a single cell
- n Regulated differentially during different cell activities
- n Speed up dramatically in mitosis
- n Endogenous cellular proteins regulate MT dynamics
- n Tubulin isotypes and post-translational modifications regulate interactions with regulatory proteins

# Microtubule-Targeted Drugs Mimic Endogenous Regulators

Regulatory Protein	Location on MT	Mechanism
Tau, MAP 2, MAP4	Surfaces	↓ dynamics, enhance G-rate
XMAP215	Surfaces	Enhance dynamicity
MCAK	+ ends	↑ catastrophe
EB1	+ ends	↓ catastrophe, ↑ rescue
CLASP 1	+ ends	Enhance dynamicity
CLIP 170	+ ends	↑ rescue
Dynactin 1 (p150Glued)	+ ends	Nucleation, recruit dynein-cargo
LIS 1	+ ends	↓ catastrophe, recruit dynein?
NudA (dynein homolog)	ends	Cat, rescue frequencies, S-rate
stathmin	- ends, + ends, surfaces	↑ catastrophe, sequester tubulin
Γ-tuRC	- ends	Nucleation
ninein	- ends	Nucleation, anchorage

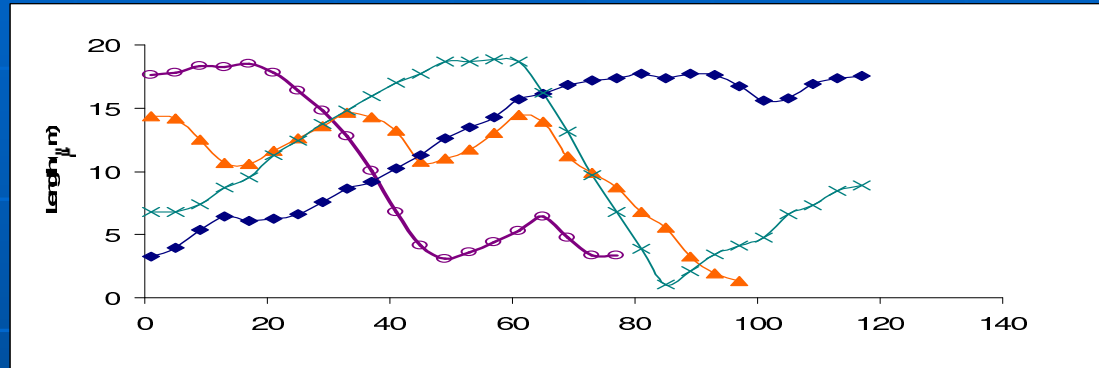

# Drugs Bind Differently to Microtubules

# Microtubule Life Histories in Live Cells: Taxol and Epothilone Suppress Dynamic Instability

Control

3.5 nM  
epothilone B

7.5 nM  
paclitaxel

# Natural Products have Yielded Potent Microtubule-Targeted Drugs

Vinca  
alkaloids

Taxanes

Laulimalide

Epothilones

Discodermolide

Colchicine

Dolastatins

Halichondrins
