# Theorem (D.-V. Voiculescu, 1991)

Let  $\mathcal{U}_\mathcal{N}^{(1)}$  $\mathcal{U}_N^{(1)}$  and  $\mathcal{U}_N^{(2)}$ N *be independent, Haar-distributed unitary matrices of size N*  $\times$  *N and*  $\{A_N\}_{N=1}^{\infty}$  *and*  $\{B_N\}_{N=1}^{\infty}$  *sequences of (nonrandom) uniformly bounded self-adjoint matrices of size*  $N \times N$  with spectral measures converging to  $\mu_A$  and  $\mu_B$ . Then, as  $N \rightarrow \infty$ .

$$
\mathcal{U}_N^{(1)} A_N \mathcal{U}_N^{(1)*} \quad \text{and} \quad \mathcal{U}_N^{(2)} B_N \mathcal{U}_N^{(2)*}
$$

*are asymptotically free.*

$$
Gives a limit law for \qquad \mathcal{U}_N^{(1)} A_N \mathcal{U}_N^{(1)*} + \mathcal{U}_N^{(2)} B_N \mathcal{U}_N^{(2)*}
$$

and

$$
A_N \mathcal{U}_N^{(1)} B_N \mathcal{U}_N^{(1)*} A_N
$$

in terms of  $\mu_A$  and  $\mu_B$ .

<span id="page-1-0"></span>ロトラ 風 トラミトラ ミュー

Simplest application:

$$
A:=P_2\mathcal{U}_N P_1\mathcal{U}_N^*P_2,
$$

*P*<sup>1</sup> and *P*<sup>2</sup> are orthogonal projections with ranks *pN* and *qN*. Let

$$
F(x)=\frac{1}{N}\sharp\{\lambda_i(A)\leq x\}.
$$

Wachter (1980): when  $F(x)$  converges almost surely to the distribution function with density

$$
f(x) := \frac{\sqrt{(\lambda_{+}-x)(x-\lambda_{-})}}{2\pi x(1-x)} I_{[\lambda_{-},\lambda_{+}]}(x) + (1-\min(p,q))\delta_{0}(x) + (\max(p+q-1,0))\delta_{1}(x),
$$

where

<span id="page-2-0"></span>
$$
\lambda_{\pm}:=p+q-2pq\pm\sqrt{4pq(1-p)(1-q)}.
$$

Simplest example of multiplicative free convolution.

See Capitaine and Casalis (2004), B. Collins [\(2](#page-1-0)[00](#page-3-0)[5](#page-1-0)[\).](#page-2-0)

 $P, Q \in \mathbb{R}^{N \times N}$ : random coordinate projections with independent diagonal entries:

- $P_{i,i} = 1$  with probability  $(1-p)$
- $Q_{i,i} = 1$  with probability  $(1 q)$ .

 $F \in \mathbb{C}^{N \times N}$ : discrete Fourier transform matrix

$$
F_{j,k} = \frac{1}{\sqrt{N}} e^{2\pi i j k/N}.
$$

# Theorem (B.F., 2011)

*The empirical eigenvalue distribution of PFQF*∗*P converges almost surely to f .*

Same behavior as for *PUQU*∗*P* where *U* has Haar distribution.

Suggests behavior related to freeness.

<span id="page-3-0"></span>**CONTRACTOR** AND RESPONDENT

#### Definition

The sequence of sets of unitary matrices  $\big\{\big\{U_N^{(i)}\big\}$ (i) \<br>N } i∈I  $\left\{ \right.$ <sup>N</sup>∈<sup>N</sup> is *asymptotically liberating* if for all  $i_1, \ldots, i_\ell \in I$  satisfying

$$
\ell \geq 2, \quad i_1 \neq i_2, \quad \ldots, \quad i_{\ell-1} \neq i_{\ell}, \quad i_{\ell} \neq i_1, \tag{1}
$$

there exists  $c(i_1, \ldots, i_\ell)$  such that

$$
\left|\mathbb{E}\mathrm{tr}\left(U_{i_1}^{(N)}A_1U_{i_1}^{(N)*}\cdots U_{i_\ell}^{(N)}A_\ell U_{i_\ell}^{(N)*}\right)\right|\leq c(i_1,\ldots,i_\ell)\|A_1\|\cdots\|A_\ell\|
$$

for all constant matrices  $A_1, \ldots, A_\ell \in \mathbb{C}^{N \times N}$  with trace zero.

<span id="page-4-0"></span> $\rightarrow \quad \left\langle \sqrt{2} \right\rangle \rightarrow \quad \left\langle \sqrt{2} \right\r$ 

- { $U_i^{(N)}$  $\{ \bigcup_{i=1}^{N+1} \}_{i \in I}$  set of random unitary matrices
- { $\{T_{i,j}^{(N)}\}$  $\{f^{(N)}_{i,j}\}_{j\in J_i}\}_{i\in I}$  set of bounded self-adjoint matrices
- $A_N$  algebra of  $N \times N$  random matrices defined on the same space as  $\{U^{(N)}_j\}$  $\left\{\begin{matrix}i^{(n)} \\ i \end{matrix}\right\}$ i $\in I$ .
- $\phi^{(N)}(A) = \frac{1}{N} \mathbb{E} \text{tr} A$
- $\bullet$   $\tau_i^{(N)}$  $\mathcal{C}^{(N)}_i:\mathbb{C}\langle\{\textbf{X}_{i,j}\}_{j\in J_i}\rangle\rightarrow\mathbb{C}$ , the joint law of  $\{\,\mathcal{T}^{(N)}_{i,j}\}$  $j,j$  } $j\in J_i$
- $\bullet \ \ \mu^{(N)}: \mathbb{C}\langle \{\{\mathbf{X}_{i,j}\}_{j\in J_i}\}_{i\in I}\rangle \rightarrow \mathbb{C},$  the joint law of

<span id="page-5-0"></span> $\{\{U_i^{(N)}\mathcal{T}_{i,j}^{(N)}U_i^{(N)}\}_{j\in J_i}\}_{i\in I}$ 

## Lemma

*Assume*

- $\tau_i = \lim_{N \to \infty} \tau_i^{(N)}$  $\sum_{i}^{N}$  exists for all  $i \in I$
- sup<sub>N</sub> max<sub>i∈I</sub> max<sub>j∈J<sub>i</sub>  $\|T_{i,j}^{(N)}\|$ </sub>  $\Vert f_{i,j}^{(N)} \Vert < \infty$
- $\bullet$  {*{*U<sup>(N)</sup><sub>i,j</sub>} i,j }j∈J<sup>i</sup> }i∈I *is asymptotically liberating*

*Then*  $\mu = \lim_{N \to \infty} \mu^{(N)}$  exists and is tracial, and the rows of  $\{\{\mathbf X_{i,j}\}_{j\in J_i}\}_{i\in I}$  $\{\{\mathbf X_{i,j}\}_{j\in J_i}\}_{i\in I}$  $\{\{\mathbf X_{i,j}\}_{j\in J_i}\}_{i\in I}$  are free from each other wit[h r](#page-4-0)e[sp](#page-6-0)[e](#page-4-0)[ct](#page-5-0) [t](#page-6-0)[o](#page-0-0)  $\mu$ [.](#page-12-0)

 $W \in \mathbb{R}^{N \times N}$  is a *random signed permuation matrix* if

$$
W(i,j)=\epsilon_i\delta_{i,\sigma(j)},
$$

where  $\epsilon_1, \ldots, \epsilon_N \in \{\pm 1\}$  and  $\sigma \in S_N$  is a permutation.

Theorem (G. Anderson and B. Farrell, 2013) Let  $\{U_{i\in I}^{(N)}\}$ i∈I } *be random unitary matrices. Assume:*

> • *For all N and deterministic signed permutation* (2)  $\textit{matrix~W}, \left\{ W^* U_{ii'}^{(N)} W \right\}_{i,i' \in I}$  $\left\{ U_{ii'}^{(N)} \right\}_{\substack{i,i' \in I \\ \text{s.t. } i \neq j'}} \stackrel{d}{=} \left\{ U_{ii'}^{(N)} \right\}_{\substack{i,i' \in I \\ \text{s.t. } i \neq j}}$  $i, i' \in I$ <br>s.t.  $i \neq i'$

<span id="page-6-0"></span>• For each positive integer 
$$
\ell
$$
 (3)  
\n
$$
\sup_{N=1}^{\infty} \max_{\substack{i,i'\in I \\ s.t. i\neq i'}} \frac{N}{\alpha,\beta=1} \sqrt{N} \left( \mathbb{E} \left| \left( U_i^{(N)*} U_{i'}^{(N)} \right) (\alpha,\beta) \right| \right)^{1/\ell} < \infty.
$$

*Then the sequence of families*  $\{U_i^{(N)}\}$ i o i∈I  $\int_{-\infty}^{\infty}$ N=1 *is asymptotically liberating.*

A matrix  $H\in \mathbb{C}^{N\times N}$  is a *general Hadamard* matrix  $\frac{1}{\sqrt{N}}$  $\frac{L}{N}$ H is unitary and  $|H(i, j)| = 1$  for all  $1 \le i, j \le N$ .

# **Corollary**

*Assume:*

- *I is a finite index set.*
- *H* (N) *is a general Hadamard matrix for each N.*
- $W^{(N)}$  is uniformly distributed on signed permutation matrices.
- { $D_i^{(N)}$ i }i∈<sup>I</sup> *are i.i.d., uniformly distributed signed permutation matrices, independent of*  $W<sup>(N)</sup>$ *.*

*Then the sequence*

$$
\left\{\left\{W^{(N)}\right\}\cup\left\{\frac{H^{(N)}}{\sqrt{N}}W^{(N)}\right\}\cup\left\{D_i^{(N)}\frac{H^{(N)}}{\sqrt{N}}W^{(N)}\right\}_{i\in I}\right\}_{N=1}^{\infty} \quad (4)
$$

*is asymptotically liberating.*

ロン イタン イミン イミン

# **Corollary**

*Assume:*

- *X and Y are bounded real random variables with distributions*  $\nu x$  and  $\nu y$ .
- $\bullet$   $\{H^{(N)}\}_{N=1}^\infty$  is a sequence of N-by-N Hadamard matrices.
- $\bullet$   $\{X^{(N)}\}_{N=1}^{\infty}$  and  $\{Y^{(N)}\}_{N=1}^{\infty}$  are independent sequences of *N-by-N diagonal matrices with indep. copies of X and Y , respectively, on the diagonal.*
- <sup>A</sup>(N) *is the algebra of random N-by-N matrices with essentially bounded complex entries defined on the same probability space as X*(N) *and Y* (N)
- $\phi^{(N)}$  is the state on  $\mathcal{A}^{(N)}$  defined by  $\phi^{(N)}(A) = \mathbb{E} \frac{1}{N} \text{tr}A$ .

*Then*

$$
X^{(N)} \quad \text{and} \quad \frac{1}{N} H^{(N)} Y^{(N)} H^{(N)*}
$$

*are asymptotically free.*

ロース 風 トラミン スキャー

From this we recover the earlier theorem.

 $P, Q \in \mathbb{R}^{N \times N}$ : random coordinate projections with independent diagonal entries:

- $P_{i,i} = 1$  with probability  $(1 p)$
- $Q_{i,i} = 1$  with probability  $(1 q)$ .

 $F \in \mathbb{C}^{N \times N}$ : discrete Fourier transform matrix

$$
F_{j,k} = \frac{1}{\sqrt{N}} e^{2\pi i j k/N}.
$$

Theorem (B.F., 2011)

*The empirical eigenvalue distribution of PFQF*∗*P converges almost surely to f .*

 $\mathcal{L}^{\mathcal{A}}\left(\mathcal{A}^{\mathcal{B}}\right) = \mathcal{L}^{\mathcal{A}}\left(\mathcal{B}^{\mathcal{B}}\right) = \mathcal{L}^{\mathcal{A}}\left(\mathcal{B}^{\mathcal{B}}\right) = \mathcal{L}^{\mathcal{A}}\left(\mathcal{B}^{\mathcal{B}}\right) = \mathcal{L}^{\mathcal{A}}\left(\mathcal{B}^{\mathcal{B}}\right) = \mathcal{L}^{\mathcal{A}}\left(\mathcal{B}^{\mathcal{B}}\right) = \mathcal{L}^{\mathcal{A}}\left(\mathcal{B}^{\mathcal{B}}$ 

Two natural avenues to pursue from this point:

- Discrete uncertainty principles.
- Relationship to classical random matrix theory.

目

 $OQ$ 

 $\mathbf{A} = \mathbf{A} \mathbf{B} + \mathbf{A$ 

### Relationship to uncertainty principles

*U* – unitary matrix  $P_1$  and  $P_2$  – coordinate projections with support sets  $S_1$  and  $S_2$ .

Suppose there exists *x* such that support $(x) \subset S_1$  and support $(Ux) \subset S_2$ . Then

$$
||P_2UP_1x||_2=||P_2Ux||_2=||Ux||_2=||x||_2,
$$

so that  $||P_2UP_1|| = 1$ .

If no such *x* exists, then  $||P_2UP_1|| < 1$ .

Thus, coordinate projections (very simple matrices) allow us to address an uncertainty principle.

This is also the simplest instance of free multiplicative convolution.

<span id="page-11-0"></span> $\Omega$ 

### Classical random matrix theory
