Let  $S$  be a subset of the vertex-cells of  $G$ .

# Partial duality for hypermaps

Let  $S$  be a subset of the vertex-cells of  $G$ .  
Choose a different type of cells, say hyperedges.

# Partial duality for hypermaps

Let  $S$  be a subset of the vertex-cells of  $G$ .

Choose a different type of cells, say hyperedges.

**Step 1.**  $\partial F$  is the boundary a surface  $F$  which is the union of the cells from  $S$  and all hyperedge-cells.

# Partial duality for hypermaps

Let  $S$  be a subset of the vertex-cells of  $G$ .

Choose a different type of cells, say hyperedges.

**Step 1.**  $\partial F$  is the boundary a surface  $F$  which is the union of the cells from  $S$  and all hyperedge-cells.

**Step 2.** Glue in a disk to each connected component of  $\partial F$ .

These will be the *hyperedge-cells* for  $G^S$ .

## Step 3. Gluing the vertex-cells.

# Partial duality for hypermaps (continuation)

## Step 3. Gluing the vertex-cells.

Step 4. Forming the partial dual hypermap  $G^S$ .

# Partial duality for hypermaps (continuation)

**Step 4.** Forming the partial dual hypermap  $G^S$ .

# Partial duality. Properties.

- (a) The resulting hypermap does not depend on the choice of type at the beginning.

# Partial duality. Properties.

- (a) The resulting hypermap does not depend on the choice of type at the beginning.
- (b)  $(G^S)^S = G$ .

# Partial duality. Properties.

- (a) The resulting hypermap does not depend on the choice of type at the beginning.
- (b)  $(G^S)^S = G$ .
- (c) There is a bijection between the cells of type  $S$  in  $G$  and the cells of the same type in  $G^S$ . This bijection preserves the valency of cells. The number of cell of other types may change.

# Partial duality. Properties.

- (c) There is a bijection between the cells of type  $S$  in  $G$  and the cells of the same type in  $G^S$ . This bijection preserves the valency of cells. The number of cell of other types may change.
- (d) Is  $s \notin S$  but has the same type as the cells of  $S$ , then  $G^{S \cup \{s\}} = (G^S)^{\{s\}}$ .
- (e)  $(G^S)^{S'} = G^{\Delta(S, S')}$ , where  $\Delta(S, S') := (S \cup S') \setminus (S \cap S')$  is the symmetric difference of sets.

# Partial duality. Properties.

- (a) The resulting hypermap does not depend on the choice of type at the beginning.
- (b)  $(G^S)^S = G$ .
- (c) There is a bijection between the cells of type  $S$  in  $G$  and the cells of the same type in  $G^S$ . This bijection preserves the valency of cells. The number of cell of other types may change.
- (d) Is  $s \notin S$  but has the same type as the cells of  $S$ , then  $G^{S \cup \{s\}} = (G^S)^{\{s\}}$ .
- (e)  $(G^S)^{S'} = G^{\Delta(S, S')}$ , where  $\Delta(S, S') := (S \cup S') \setminus (S \cap S')$  is the symmetric difference of sets.
- (f) The partial duality preserves orientability of hypermaps.

# Partial duality in $\tau$ -model.

**Theorem.** Consider the  $\tau$ -model for a hypermap  $G$  given by the permutations  $\tau_0(G) : (v, e, f) \mapsto (v', e, f)$ ,  $\tau_1(G) : (v, e, f) \mapsto (v, e', f)$ ,  $\tau_2(G) : (v, e, f) \mapsto (v, e, f')$  of its local flags. Let  $V'$  be a subset of its vertices,  $\tau_1^{V'}$  be the product of all transpositions in  $\tau_1$  for  $v \in V'$ , and  $\tau_2^{V'}$  be the product of all transpositions in  $\tau_2$  for  $v \in V'$ . Then its partial dual  $G^{V'}$  is given by the permutations

$$\tau_0(G^{V'}) = \tau_0, \quad \tau_1(G^{V'}) = \tau_1 \tau_1^{V'} \tau_2^{V'}, \quad \tau_2(G^{V'}) = \tau_1 \tau_1^{V'} \tau_2^{V'}.$$

In other words the permutations  $\tau_1$  and  $\tau_2$  swap their transpositions of local flags around the vertices in  $V'$ . The similar statement hold for partial duality relative to the subset of hyperedges  $E'$  and for a subset of faces  $F'$ .

# Partial duality in $\tau$ -model. Example.

$$\tau_0 = (1, 11)(2, 12)(3, 10)(4, 8)(5, 9)(6, 7)$$

$$\tau_1 = (1, 2)(3, 4)(5, 6)(7, 9)(8, 10)(11, 12)$$

$$\tau_2 = (1, 6)(2, 3)(4, 5)(7, 11)(8, 9)(10, 12)$$

# Partial duality in $\tau$ -model. Example.

$$\tau_0 = (1, 11)(2, 12)(3, 10)(4, 8)(5, 9)(6, 7)$$

$$\tau_1 = (1, 2)(3, 4)(5, 6)(7, 9)(8, 10)(11, 12)$$

$$\tau_2 = (1, 6)(2, 3)(4, 5)(7, 11)(8, 9)(10, 12)$$

$$\tau_0 = (1, 11)(2, 12)(3, 10)(4, 8)(5, 9)(6, 7)$$

$$\tau_1 = (1, 6)(2, 3)(4, 5)(7, 9)(8, 10)(11, 12)$$

$$\tau_2 = (1, 2)(3, 4)(5, 6)(7, 11)(8, 9)(10, 12)$$

**Theorem.** Let  $S$  be a subsets  $S := V'$  of vertices (resp. subset of hyperedges  $S := E'$  and subset of faces  $S := F'$ ) of a hypermap  $G$ . Then its partial dual is given by the permutations

$$G^{V'} = (\sigma_{\overline{V'}}\sigma_{V'}^{-1}, \sigma_E\sigma_{V'}, \sigma_{V'}\sigma_F)$$

$$G^{E'} = (\sigma_{E'}\sigma_V, \sigma_{\overline{E'}}\sigma_{E'}^{-1}, \sigma_F\sigma_{E'})$$

$$G^{F'} = (\sigma_V\sigma_{F'}, \sigma_{F'}\sigma_E, \sigma_{\overline{F'}}\sigma_{F'}^{-1}),$$

where  $\sigma_{V'}$ ,  $\sigma_{E'}$ ,  $\sigma_{F'}$  denote the permutations consisting of cycles corresponding to the elements of  $V'$ ,  $E'$ ,  $F'$  respectively, and overline means the complementary set of cycles.

# Partial duality in $\sigma$ -model. Example.

$$\sigma_V = (1, 3, 5)(7, 8, 12)$$

$$\sigma_E = (1, 7)(3, 12)(5, 8)$$

$$\sigma_F = (1, 12)(3, 8)(5, 7)$$

# Partial duality in $\sigma$ -model. Example.

$$\sigma_V = (1, 3, 5)(7, 8, 12)$$

$$\sigma_E = (1, 7)(3, 12)(5, 8)$$

$$\sigma_F = (1, 12)(3, 8)(5, 7)$$

$$\sigma_V(G^{\{V\}}) = \sigma_{\overline{V'}} \sigma_{V'}^{-1} = (1, 5, 3)(7, 8, 12)$$

$$\sigma_E(G^{\{V\}}) = \sigma_E \sigma_{V'} = (1, 12, 3, 8, 5, 7)$$

$$\sigma_F(G^{\{V\}}) = \sigma_{V'} \sigma_F = (1, 12, 3, 8, 5, 7)$$
